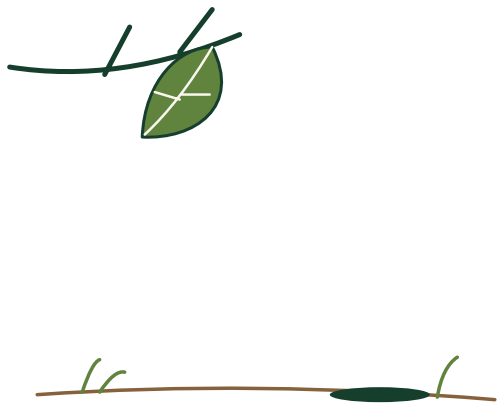
Leaf drift

Study 01 / 3.2 seconds / explicit playback / no loop



0-640 ms	The leaf releases; the branch stays still.
640-1376 ms	The leaf reverses tilt in a flutter.
1376-2912 ms	Translation carries it down and across.
2912-3200 ms	The final rotation settles beside its shadow.

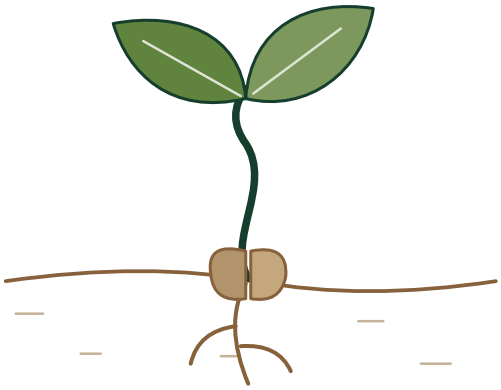
How the movement is made

Six transform keyframes move one leaf, with a delayed shadow. The SVG stays stationary. The leaf uses cubic-bezier(.77,0,.175,1).

Use sceneSvg(kind) and createScenePlayer(svg, kind) from nature-scenes.js. The player exposes play, pause, resume, seek, speed, reset and dispose. Respect prefers-reduced-motion: show the final composition. Dispose on route exit; reset on a hidden tab. Interface feedback stays 140-240 ms.

Seed germination

Study 02 / 5.2 seconds / explicit playback / no loop



200-1100 ms	Two shell halves separate and rotate.
500-2350 ms	Primary and branching roots draw below soil.
1700-3500 ms	A curved shoot draws upward.
3500-5200 ms	Left and right cotyledons rotate open in sequence.

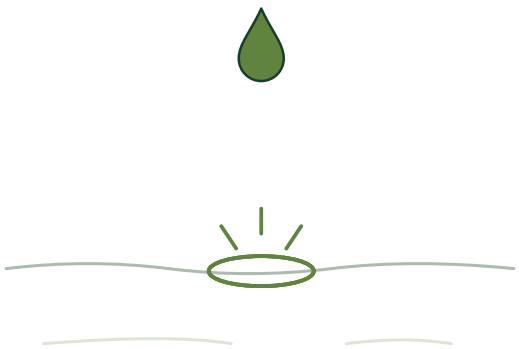
How the movement is made

Root and shoot paths use their actual length as dash offsets. Each leaf opens around the shoot tip. Parts overlap in time to create continuous growth.

Use sceneSvg(kind) and createScenePlayer(svg, kind) from nature-scenes.js. The player exposes play, pause, resume, seek, speed, reset and dispose. Respect prefers-reduced-motion: show the final composition. Dispose on route exit; reset on a hidden tab. Interface feedback stays 140-240 ms.

Water ripple

Study 03 / 2.6 seconds / explicit playback / no loop



0-650 ms	A droplet descends to the surface.
580-1180 ms	A small splash appears and recedes.
600-2600 ms	Three elliptical rings widen with 150 ms offsets.
2300-2600 ms	The last ring fades into still water.

How the movement is made

The droplet translates independently. Three rings scale from the surface point and fade. The waterline stays still; the whole icon never pulses.

Use sceneSvg(kind) and createScenePlayer(svg, kind) from nature-scenes.js. The player exposes play, pause, resume, seek, speed, reset and dispose. Respect prefers-reduced-motion: show the final composition. Dispose on route exit; reset on a hidden tab. Interface feedback stays 140-240 ms.

Trail journey

Study 04 / 3.6 seconds / explicit playback / no loop

0-900 ms	The traveller begins at the lower left.
900-1800 ms	The trail curves around the first bend.
1800-2700 ms	The route ascends toward the ridge.
2700-3600 ms	The traveller reaches the upper endpoint.

How the movement is made

The trail stroke draws with dash offset. The traveller follows the same curved CSS offset-path with linear offset-distance, rather than sliding across the card.

Use sceneSvg(kind) and createScenePlayer(svg, kind) from nature-scenes.js. The player exposes play, pause, resume, seek, speed, reset and dispose. Respect prefers-reduced-motion: show the final composition. Dispose on route exit; reset on a hidden tab. Interface feedback stays 140-240 ms.
